

Commando Robot 3D Documentation

Overview

The **Commando Robot 3D** is thoughtfully developed and user-friendly. Function names are clear, and scripts provide step-by-step guidance. This documentation explains the project folders functions. If you encounter any issues, please contact us at blackrosedevelopers@gmail.com.

Project Structure

1. Art

This folder has five subfolders as below:

- **Animations**

This folder contains enemies and character animations. (29 items)

- **Materials**

Contains 44 various materials used in the game, which can be customized with different colours or sprites.

- **Models**

Contains 9 different 3D models. (FBX)

- **Sprites**

Contains 15 UI PNG sprites.

- **Textures**

Contains 17 Bullets and Particles textures .

2. Prefabs

The Prefabs folder includes five main categories with 118 prefabs:

- **Admob**: 3 prefabs needed to show admob
- **CharacterBodies**: Contains 7 prefabs of all characters in the template.
- **Enemies**: Contains 7 prefabs of boss enemy and other types of enemies that can be used in levels.
- **Gameplay**: Contains 7 prefabs of input control and other needed elements in the game.
- **Objects**: 35 unique prefabs needed in level design.
- **Particles**: 17 unique particle effects with different materials.
- **Pickups**: 6 different prefabs that can be collected throughout the gameplay.
- **Player**: a prefab of main character in main menu and in main game scene.
- **Weapons**: 13 player, enemy and weapon models.
- **Projectile**: 10 prefabs of bullets for enemy and main character.
- **Triggers**: a unique prefabs of trigger events.
- **UI**: 11 Prefabs of the game menus and UI elements.

3. Scenes

- **Level-1 – 5** : 5 different levels of the gameplay
- **MainMenu** : starting scene of the game

4. Scriptable Object

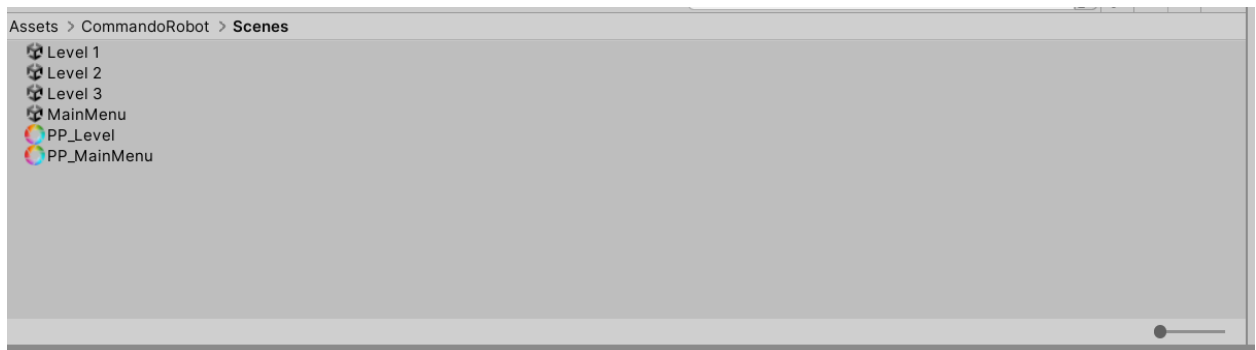

5 different scriptables to save data, assign weapons and scriptable object to save the checkpoints and last unlocked levels of the game.

5. Scripts

62 Scripts are categorized into ten folders, with clear names and functions to ensure easy understanding.

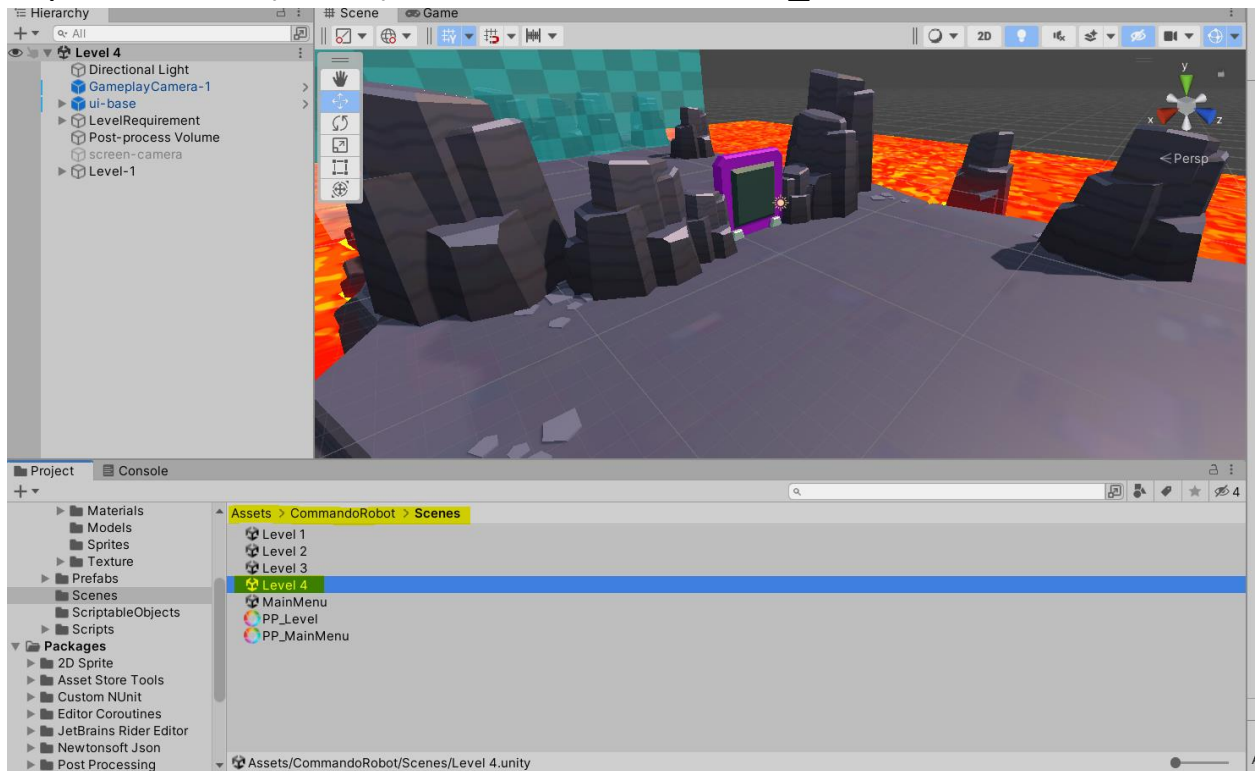

- [How to Activate ADMOB](#)
- **How to add new levels:**

1- Navigate to Project – Scenes folder. Find Level_1 to 3 and double click on one of them to enter the game play scene. I choose Level-1 here.

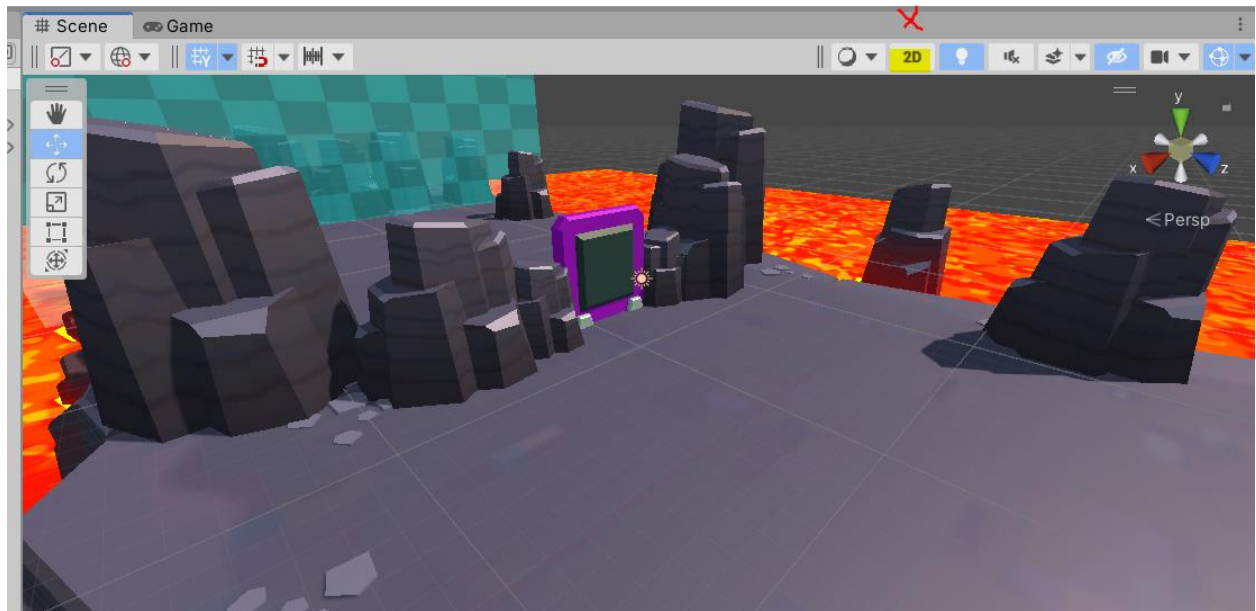

2- The best way for creating a new level is to copy one of the Level_1 to 3 scenes and start changing it in a way that you desire. Here I

copied Level-1 (ctrl+d) and rename it to Level_4.

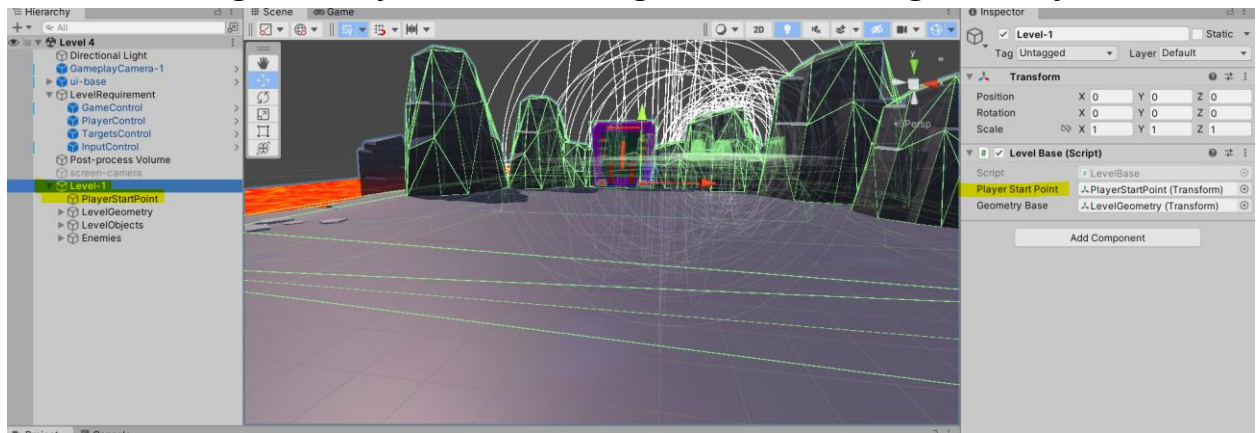

3- Bear in mind that level design is in 3D scene, so it is better to toggle off 2D.

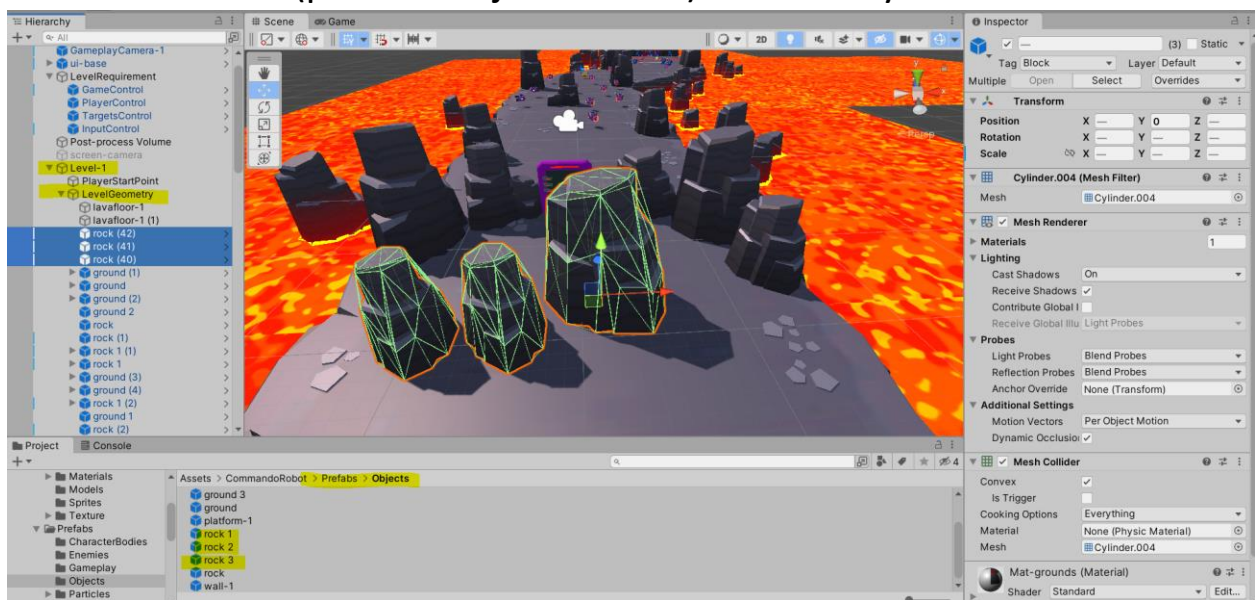

Find Level-1 Game object and then PlayerStartPoint game object. That is where the game starts and your character appears. As you

can see, this game object is also assigned to Level-1 game object.

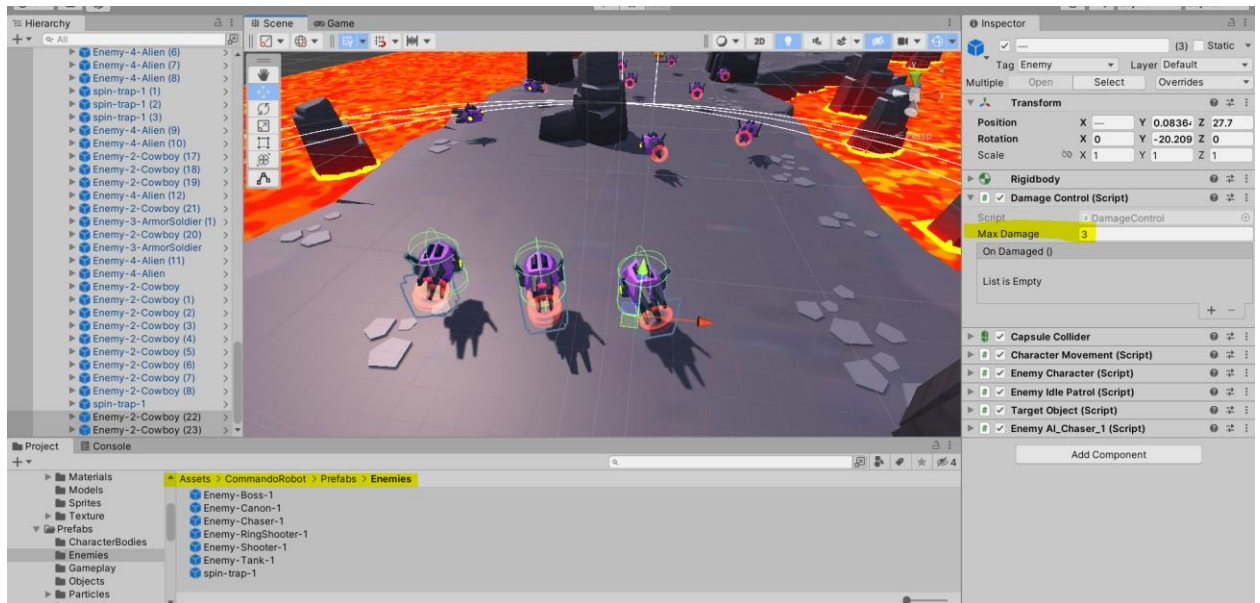

- 4- You can add different prefab on your way to the end. It is better to add it in Level Geometry to keep the scene organized. I decided to add three Rocks (prefabs-objects folder) on the way here.

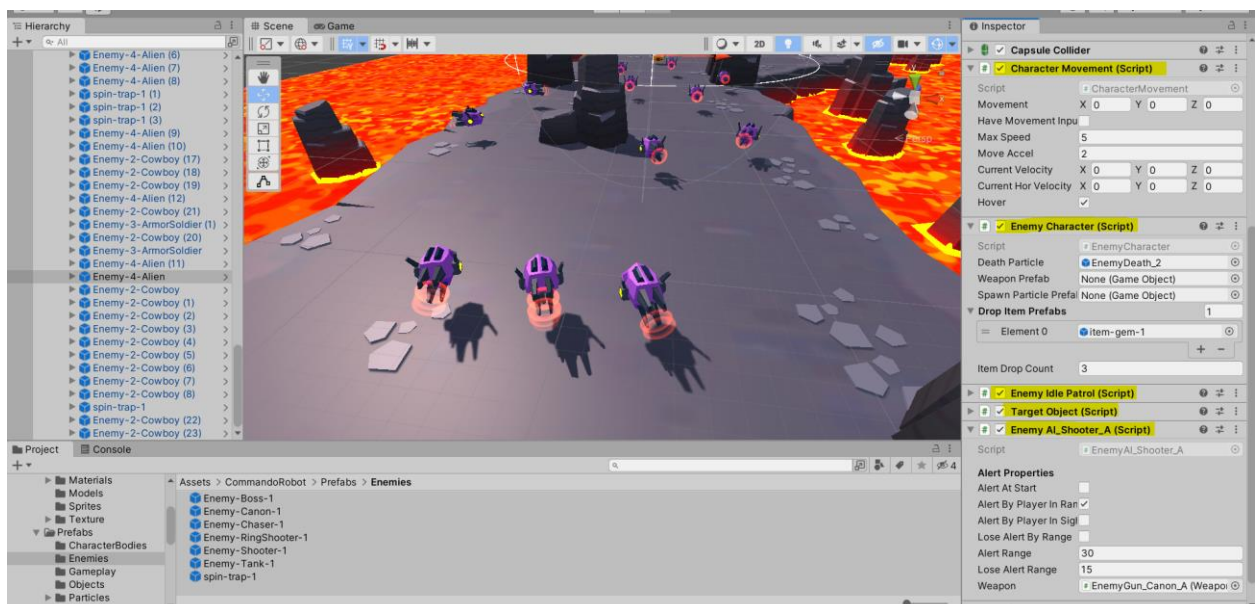

- 5- As you move on the way to the end of your level, you can add different types of enemies. Here I added 3 EnemyCowboy prefabs (prefabs – enemies) folder. You can set the Max damage for each enemy which determines how many bullets are needed for them

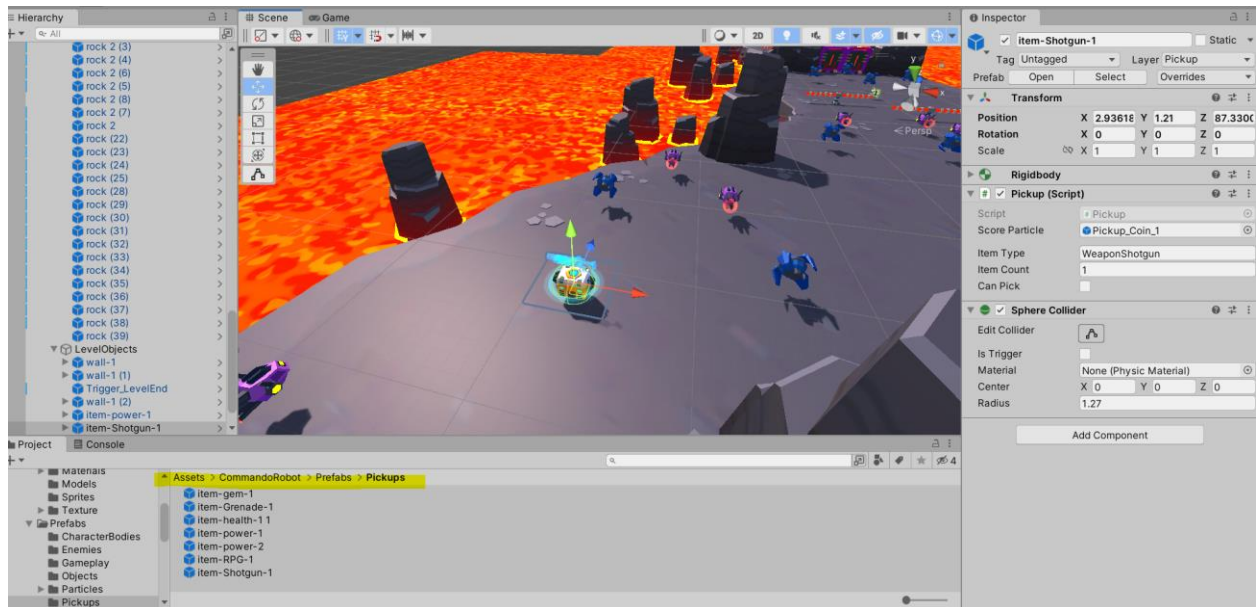

to blow up.

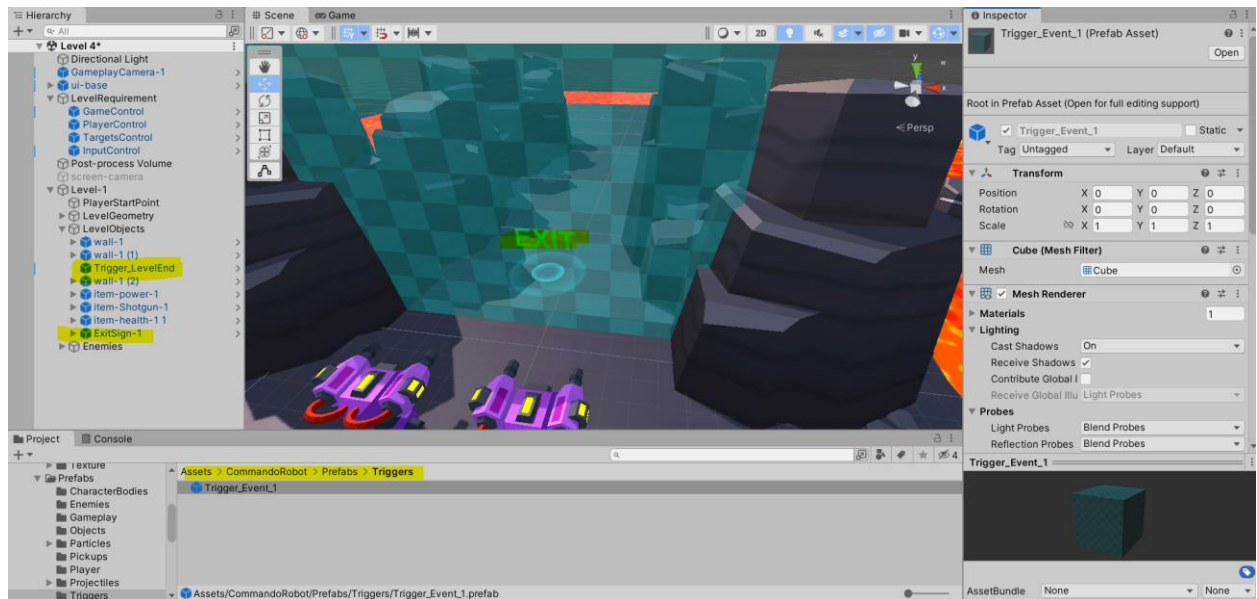

6- There are different variables that you can set for your enemy. Item Drop count determines the number of coins each enemy will drop after destruction. Max speed shows how fast it will reach you and other variables such as Alert range which determines with what distance starts attacking. You can change these variables for any of the enemies you put in the level.

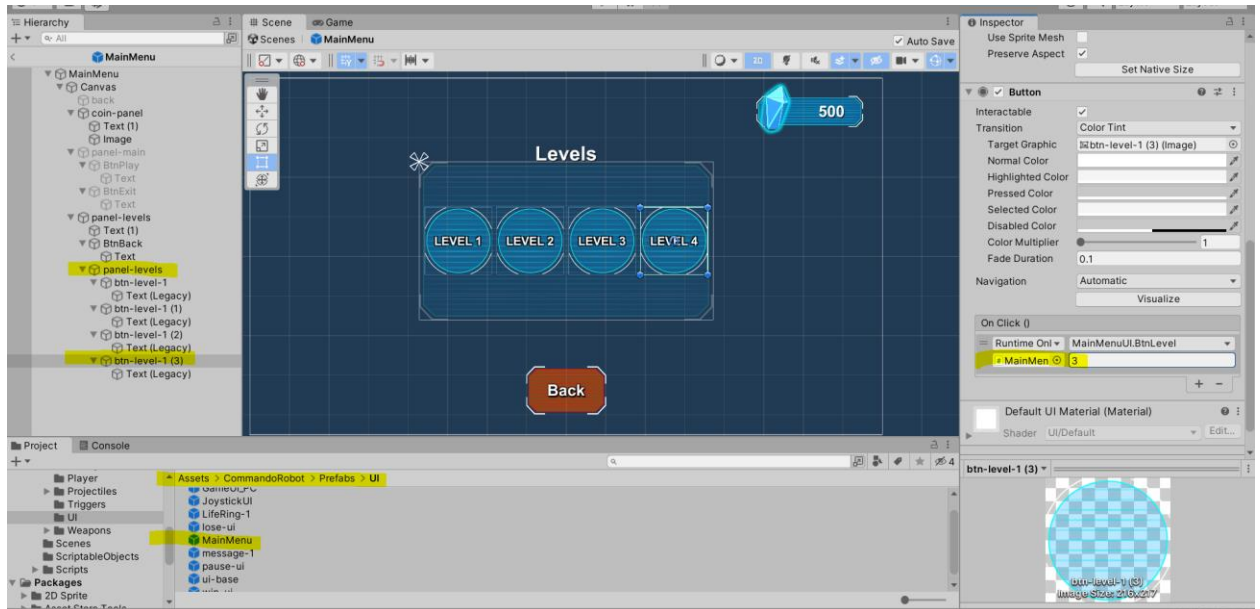

7- You can also put Pickups (prefabs – pickups folder) on the character way to collect.

8- Reaching at the End of your level, it is recommended to put the exit sign for clarity. However, it is must to have TriggerLevelEnd prefab (prefabs-trigger folder) so that when the character walks through, the level ends.

- 9- When you are done level designing, don't forget to add you new level button in MainMenu prefab (Prefabs-UI) and set the button click to your scene index number (in this case Level 4 index would be 3)
